Abstract

Atmosphere clean would take to play an importantly and newly innovative role so that the strategic diagram need to be given in the future at all. The collaborative operation would be pursuing in light of varying functional entities for completing a series reformative institution and constitution in the high end products research and manufacture, as an important conclusion of whose strategic plan for satisfying those suggestions is needed to construct continuously. New talents are going to be welcomed for joining the national enterprise to push the high educational people innovation and creation furthers in manufacturers. A investor has pursued the transaction and her profit has been attaining about 6,370 yuan with owning 5,700 shares for 14 yuan buying price, which is reported in WeChat of Internet, April 15th, 2024. Beyond that point with 3,000 shares the more profit would be arrived whilst the risk becomes higher.

Keywords: Principle; Developing sustainable economy; Stocks; Price; High end product; Shares; Customer; Company; Atmosphere; Green finance; Sustainability economy

Introduction

Because the stock exchange has been occupying more and more people interest, there is more stocks company to attract individual share in the society. In current situation the stock market would be prevalent with enhancing more and more people for joining the stock market to exchange. The important effective factor may be heavier and heavier. For the sake of satisfying this demand the principle would be supposed through scientific data from simulating method with quadratic function of mathematical numerous calculation which is established according to the microeconomics knowledge through proposing stock shares labour and capital distribution. As for developing high quality sustainability economy is going to divide into three segments etc. through regulated each aspect of profiting allocation and especially in clean atmosphere aspect. In light of distributed those allocations the scientific one will be formed for improving parameters precision whilst the other two has included in increasing efficiency and declining cost. So only in those methods can the scientific

modelling could be being attained for sustaining stocks development. The more high educational talents could have been demanded in future especially in institution of university, thereof the expertise training should be needed in scientific and technical institution of university & research and development division in a firm where the highest talents will be anticipated and participated in near future. The principle of dealing with the stock becomes key technological know-how on high price of stocks if the right stock could be chosen in light of the risk for stock business. On the other side, the corrective modelings could be used for analyzing every emphasis manufacturer price is precision well. To create technological relations and achievement transformation may improve green low carbon, energy enterprise and digital technique melting development. Maintaining key competition capacity may be enhanced in resource industrial part. In current situation, many sustainability economies mutually affect and correlate with new roles sustainability economy, stock and green financial new developments on various departments. They will wield accordingly other disciplines for creating new functional ones to teach and learn

& search for further research in future. The created one would be utilized for new direction to be searched in university firstly, and then it can be used in manufacturer after evaluating its cost calculation and functional improvement points [1-9].

Discussions

Principle for choosing stocks exchange

Figure 1: Schema between profits and shares in light of the profit line and total cost curve.

As shown in Figure 1 it may be shown the maximum profit has been attaining about 20,000 yuan with owning 4,000 shares for 22 yuan buying price at the c point according to the modelling computations. Beyond that point with 4,000 shares the more profit would be arrived whilst the risk becomes higher, which was observed. The capital input will be an important factor for enhancing the stock price. The c, c' & c'' represents the intersection whose mean has been presenting that the profit may equal to the total cost while A, B & C presents those three points respectively in shares, its value will surpass the maximum cost & exceed the zero cost respectively. Thereby, the quantity more than c' will be profiting more money whilst c'' will be earning most money according to the modelling calculation of high stock prices with quadratic and linear equations as mentioned above. This paper would not ensure that the earning money must happen in light of the mentioned advice value since the risk should be prudential under much consideration. North Capital has indicated overseas institution investors primarily who own much capital and expertise research capability & collecting information teams. Since North Capital has been prior to domestic one step the smart capital may be named as A stock indicator. [7] An investor has pursued transaction and attained 6,370 yuan of profit with 5,700 shares under 14 yuan price for [Xinya Electronic] according to report on Wechat of Internet, April 15th, 2024. That would be corresponding to the theoretical prediction well with 22 yuan price where 4,000 shares shall be intersection value and the maximum profit should reach 20,000 yuan, thereby the elastic space will still exist in. If the various price is going to be considered that will be 8 yuan, thereby the 12,000 yuan will be afforded to be maximum profit where the about 6,000 yuan may be profited further if increasing share number or awaiting for the higher price. Therein the former one will realize super short term which is a good status for changing

turnover whilst the latter one would keep up for sometime that is stable one. [Jianshe Mechanical Corp. Has a strong force with three continuous increase limiting on April 15th, 2024. The scientific inspection will be pursued continuously and regulated frequently in light of the fact data whose correction could be analyzed with utilizing qualitative research method by now. The finer data would be created forwards whilst the complicate formulae have to be proposed periodically for progressing the theoretic mode and modeling on behalf of one customer' route solving the reasonable price of stocks choice etc. a series matters. In short, to achieve high-quality development of green finance requires the joint efforts of the government, financial institutions and all sectors of society. Only through various measures such as policy guidance, system construction, transformation and innovation, education and publicity, and international cooperation and exchange, can we promote the healthy development of green finance and achieve a win-win situation for economy, society and environment. As known the green financial development has been important factor in economic society whose effectiveness is able to boost economy forward and advanced on the world. Therein, the emphasis support and sponsor will enable it to acquire enough stimulation for promoting financial reformative development that includes like investing green strategic plan etc. The principle for dealing stocks transaction would be basing on modeling computation in light of various coefficients from supposing condition like total cost, quantity etc. Where the ultimate maximum profit and maximum shares could be calculated for us to make a decision. The conditions would be finished through linear and parabolic formulae to choose the maximum profit and shares reasonably and scientifically to compare with the practical operational behavior for seeking the optimum conditions at last. In terms of the last study the elastic space would be existing in still, thereby the reasonably choosing right stock with buying price and selling one can be corresponding to well through running this modeling simulation. There is a good delicate strong force stock with nation entitled achieving golden one. In current status the main capital is buying a biggest scale amount whose tendency exhibits multi-heads parallel regarded as short term continuous goodness in light of Donganding-Yashang golden, Wechat April 16th, 2024.

The relationship between green finance and talent

The relationship between them can be discussed from many aspects where the detailing discussion is narrated as below four aspects. Therein, the excellent talent who possesses expertise basis will be pursuing an important role for developing high quality green finance, which can be emphasized and included in [6]. First, talent is one of the key factors to promote the development of green finance. In the field of green finance, talents should not only possess solid financial knowledge and skills, but also have an understanding and concern for environmental protection and sustainable development. Therefore, it is very important for

financial institutions and governments to cultivate and introduce talents with green finance knowledge and skills. Second, green finance also needs to attract more professionals. In order to attract these talents, financial institutions and governments need to provide better working environment and treatment, such as good working environment, career development opportunities, training opportunities, etc. In addition, the field of green finance also needs to strengthen talent training to provide more talents with space and opportunities for development. However, the relationship between green finance and talent is not just one-way. Financial institutions and the government need to strengthen the training and management of talents while cultivating and introducing talents. For example, relevant training activities can be organized regularly to improve talents' awareness and understanding of green finance; At the same time, we can also establish a sound talent management system to encourage talents to play their potential and improve work efficiency and quality. In addition, the development of green finance also needs the innovative spirit and practical ability of

talents. In the field of green finance, talents need to have innovative thinking and innovation ability, and be able to constantly explore new financial instruments and products to support the development of green economy. At the same time, talents also need to have certain practical experience and be able to convert theoretical knowledge into practical operation ability to promote the practice and development of green finance. In short, the relationship between green finance and talents is mutually promoting and influencing. Financial institutions and governments need to strengthen the training and introduction of talent, and provide better working conditions and benefits; At the same time, we should strengthen the training and management of talents, and encourage talents to play their potential; In addition, it is also necessary to pay attention to the cultivation of talents' innovative spirit and practical ability, and promote the practice and development of green finance. Only in this way can we truly realize the development of green finance and the cultivation of talents.

Conclusions

Through the principle for choosing right stock the parabolic function has been used for solving the basis problems such as the right stocks, the price, shares to transact exchange of stocks in this study. The high quality development of new high end technology for strategic plan would be proposed and continued to develop constantly in university and R &D(Research & development) department of firm. Through government making policies to guarantee and monitor its course could be finished collaboratively and correlatively with firms. With regard to strengthening the educated talents they should be expertise ability under college department speciality who is able to complete that task for a certain degree in R & D department. The primary task met in regional economic development should be planned with strategic diagram and applied to a series of different departments. Cooperative and initiative capability and aptitude would be demanded in high quality new productivity developing course where the technologically innovative achievement transformation and industrial modernization would be attained. A investor has pursued transaction and attained 63,70 yuan of profit with 5,700 shares under 14 yuan price for [XinYa electronic] according to report on WeChat of Internet, April 15th, 2024.
